Fractions: a short guide

CLASS 7 / STUDY MATERIAL

Equal parts

A fraction describes equal parts of a whole. In 3/4, the denominator 4 counts all equal parts; the numerator 3 counts the parts selected.

Equivalent fractions

Multiplying both numbers by the same nonzero number preserves the value. For example: 1/2 = 2/4 = 3/6.

Adding like denominators

Add the numerators and keep the common denominator.
Example: 2/7 + 3/7 = 5/7.

Try it yourself

A. Write an equivalent fraction for 2/3 using denominator 12.
B. Add 1/8 and 5/8. Simplify the answer.
C. Explain why the parts must be equal.

Check your work

A. 8/12. B. 6/8 = 3/4.
C. Equal parts make the size of each fractional unit consistent.
